

Adobe Experience Platform:

1. **Guide for configuration and use**

To set up the Adjust SDK Extension, follow these steps.

Log in to Adobe Launch

Select the **Extensions** tab in your property's overview page

Find **Adjust SDK Extension** in the catalog

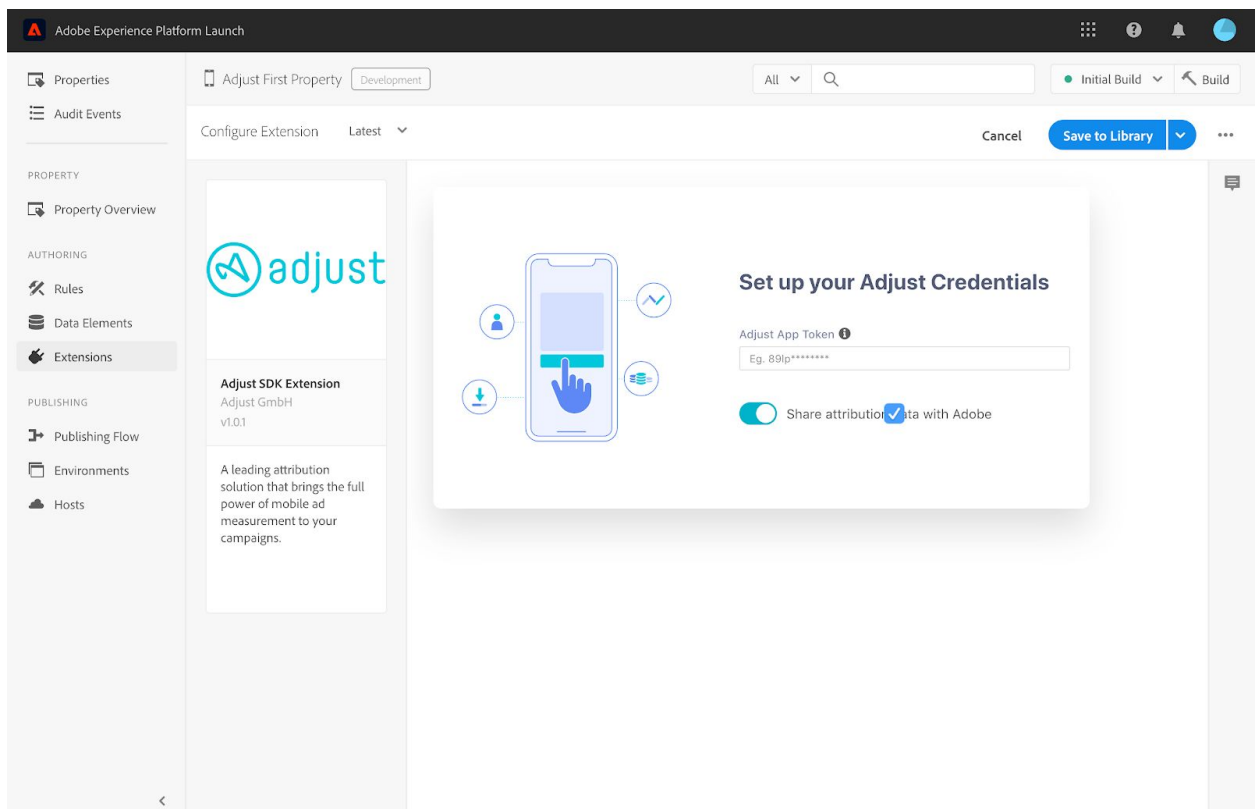

Select **Install**

Enter your Adjust app token ([Learn more](#))

Check attribution data sharing with Adobe is ON

Select **Save to Library**

In the event Share Attribution Data with Adobe is turned OFF, Adjust will continue to track your data. However, this data will not be shared with Adobe and therefore will not display in Adobe's dashboard.

Publishing the environment:

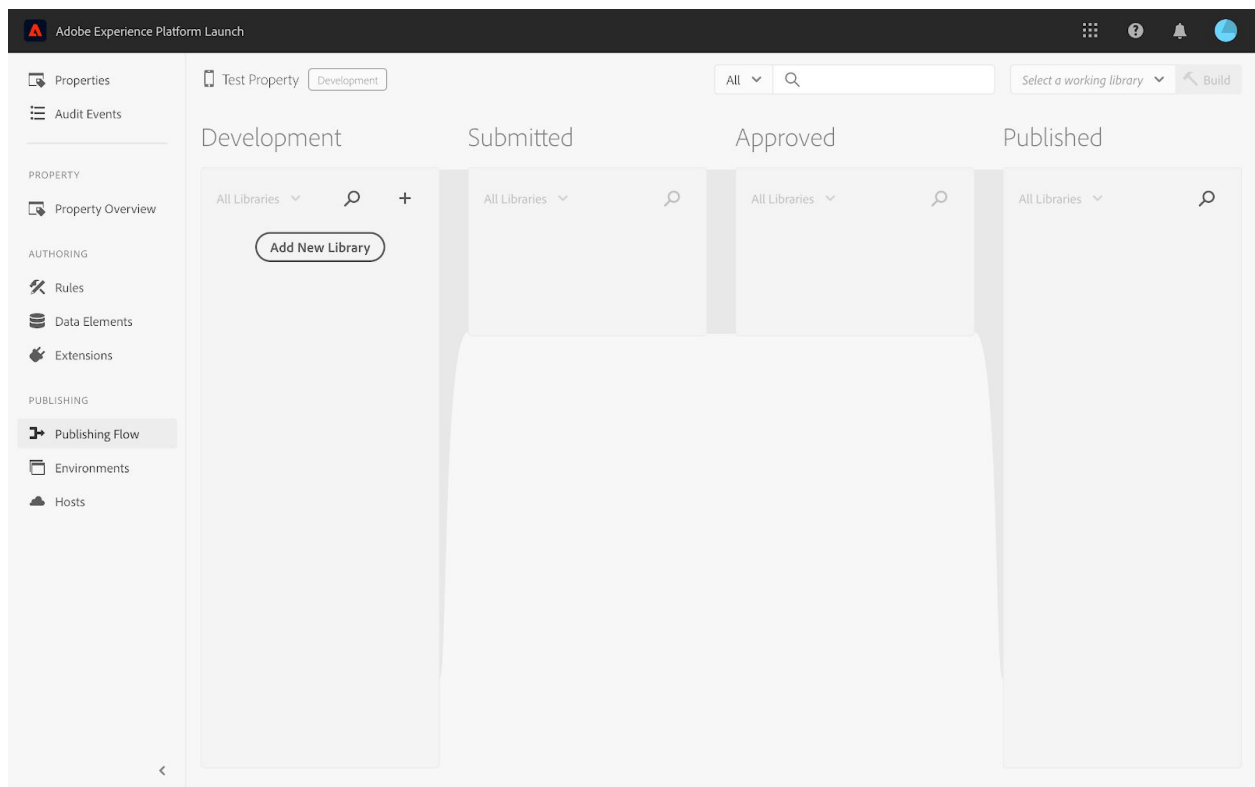

After saving the extension configuration, you need to publish your environment.

1. Open your property's overview page
2. Select **Publishing flow** in the left-hand menu
3. Select **Add new library** [1]
4. Enter a name
5. Select the "Development" environment[2]
6. Select **Save & build for development**

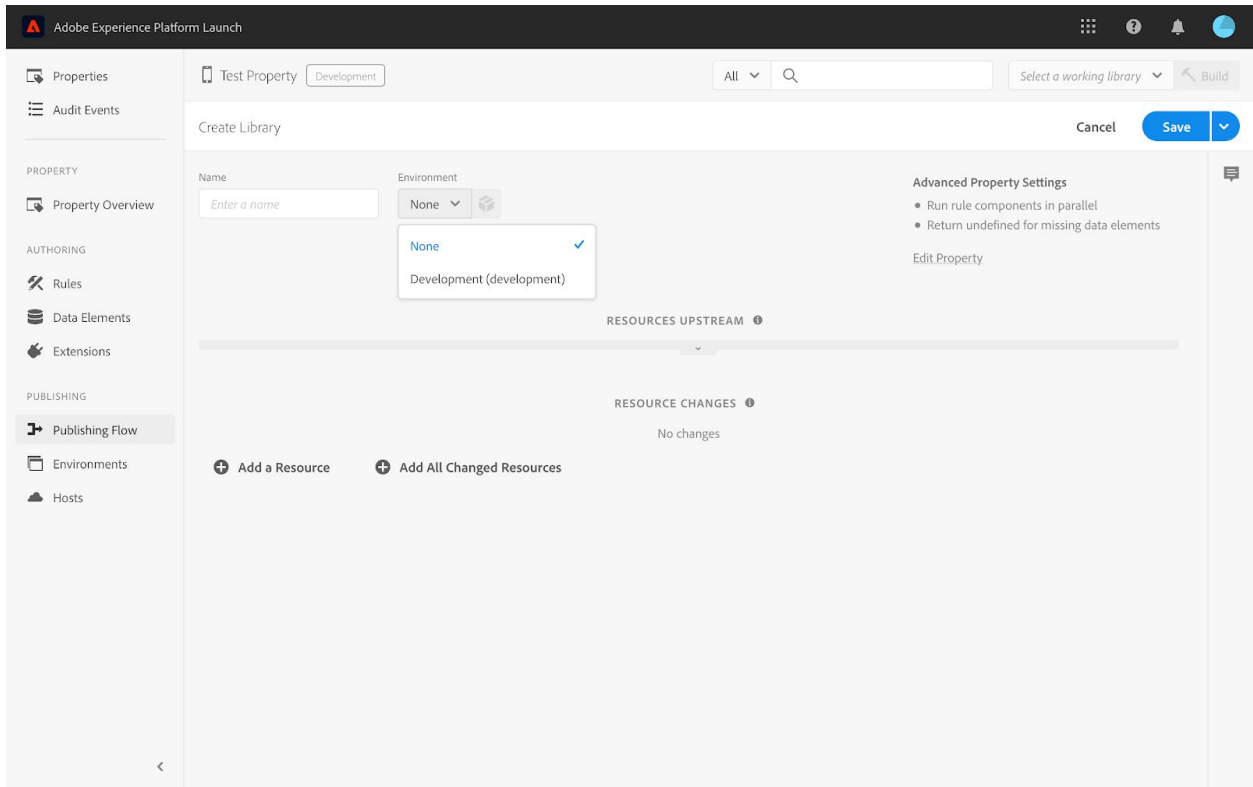

This starts the build. Once the build is finished you will see a green dot next to the library name. This signals you can test the implementation with Adobe's development app ID.

1. After you have tested and are ready to submit, select **Options (three dots icon) > Submit for approval** [3]
2. In the "Submitted" column, select **Options > Build for Staging** and then **Approve for Publishing** [4]
3. In the "Approved" column, select **Options > Build & Publish for Production** and then **Approve for Publishing** [5]

3. Extension description for Adobe's Panel

Following this logic: The description of your extension. This will be shown to users of Launch. If your extension empowers users to implement your product on their website, describe what your product does. There is no need to mention "Launch" or "Extension"; users will already know they are looking at a Launch extension.

A leading attribution solution that brings the full power of mobile ad measurement to your campaigns.
